

ADDITION

Counting All	Counting On	Adding Up in Chunks
<p><i>Strategy Explained</i></p> <p>$3 + 2$</p> <p>When counting all, the child counts to find the quantity of the first number (one, two, three on one hand), counts to find the quantity of the second number (one, two on the other hand), and then counts both hands to find the total.</p> 	<p><i>Strategy Explained</i></p> <p>$7 + 5$</p> <p>When counting on, the child starts with one of the numbers and counts on from this point. Children should be encouraged to count on from the larger number as they get more comfortable with this strategy.</p> <p>Example:</p> <p>“7 ... 8, 9, 10, 11, 12”</p> 	<p><i>Strategy Explained</i></p> <p>$63 + 28$</p> <p>When add up in chunks, a child will keep on addend whole and add the second number in easy-to-use chunks.</p> <p>Example:</p> 
Doubles/Near Doubles	Friendly Numbers/Round and Adjust	Place Value/Partial Sums
<p><i>Strategy Explained</i></p> <p>$12 + 13$</p> <p>When using doubles or near doubles, the child uses the recall of their doubles facts to help them efficiently add.</p> <p>Example:</p> <p>“I know 12 plus 12 is 24, so 12 plus 13 is one more than that ... 25”</p>	<p><i>Strategy Explained</i></p> <p>Students add to or subtract from one of the addends to make an easy number to add.</p> <p>Example:</p> <p>$63 + 28$</p> <p>$28 + 2 = 30$ (round) $63 + 30 = 93$ $93 - 2 = 91$ (adjust)</p> 	<p><i>Strategy Explained</i></p> <p>When using place value, the child breaks each number (decomposes) into multiple numbers based on their place value, and then like values are combined.</p> <p>Example</p> 

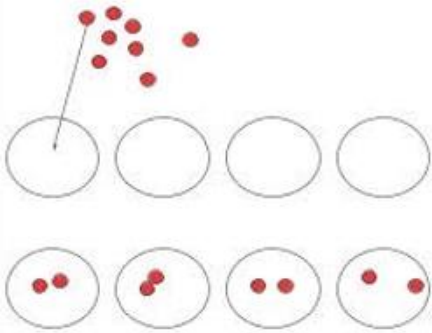

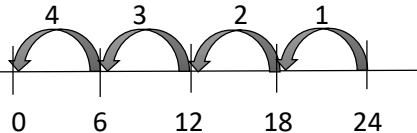

SUBTRACTION

Adding Up/Counting Back or Removal	Removal in Chunks/Adding Up in Chunks	
<p><i>Adding Up Strategy Explained</i></p> <p>8 – 3</p> <p>Students start at 3 and add up until they arrive at 8.</p> <p>“3 ... 4, 5, 6, 7, 8”</p>  <p>Counting Back Strategy Explained</p> <p>8 – 3</p> <p>Students start at 8 and count backwards 3</p> 	<p><i>Removal in Chunks Strategy Explained</i></p> <p>This strategy is essentially ‘take-away’ but using more efficient counting strategies to do so.</p> <p>Example:</p> <p>68 – 23</p> <p>$68 - (10 + 10 + 3) = 45$</p> <p>OR</p> <p>68 – 23 68 – 20 = 48 48 – 3 = 45</p> 	<p><i>Adding Up in Chunks Strategy Explained</i></p> <p>This strategy is based on students understanding that subtraction can be the difference or space between two numbers.</p> <p>Example</p> <p>68 - 23</p> <p>$23 + 10 = 33$ $33 + 10 = 43$ $43 + 10 = 53$ $53 + 10 = 63$ $63 + 5 = 68$ $10 + 10 + 10 + 10 + 5 = 45$</p> 
Friendly Numbers/Round and Adjust	Place Value and Negative Numbers	Keeping a Constant Difference
<p><i>Strategy Explained</i></p> <p>Students add to or subtract from the subtrahend to make an easier number to subtract.</p> <p>Example:</p> <p>68 – 23 23 – 3 = 20 (round) 68 – 20 = 48 48 – 3 = 45 (adjust)</p>	<p><i>Strategy Explained</i></p> <p>Each number is broken apart into its respective place value then subtracted based on place value.</p> <p>Example:</p> $\begin{array}{r} 63 \\ \swarrow \searrow \\ 60 \quad 3 \end{array} - \begin{array}{r} 28 \\ \swarrow \searrow \\ 20 \quad 8 \end{array}$ <p>$60 - 20 = 40$ $3 - 8 = -5$ $40 - 5 = 35$</p>	<p><i>Strategy Explained</i></p> <p>Adding or subtracting the same quantity from both the subtrahend and the minuend maintains the difference between the numbers.</p> <p>Example</p> $\begin{array}{r} 63 \\ +2 \curvearrowright \\ 65 \end{array} - \begin{array}{r} 28 \\ \curvearrowleft +2 \\ 30 \end{array} = 35$ 

MULTIPLICATION

Skip Counting/Repeated Addition	Doubling	Friendly Numbers
<p><i>Strategy Explained</i></p> <p>Students count (or add up) by a number to find the product.</p> <p>Example:</p> <p>4×7 as 4 groups of 7</p> <p>4, 8, 12, 16, 20, 24, 28 7, 14, 21, 28</p> <p>$4 + 4 + 4 + 4 + 4 + 4 + 4 = 28$ $7 + 7 + 7 + 7 = 28$</p> <p>4×7</p> 	<p><i>Strategy Explained</i></p> <p>Students use their knowledge of skip counting and doubles or “times 2” facts to determine the product in more sophisticated situations.</p> <p>Example:</p> <p>4×3</p> <p>$2 \times 3 = 6$ $2 \times 3 = 6$</p> 	<p><i>Strategy Explained</i></p> <p>Students use facts they know to help them solve facts they do not know.</p> <p>Example:</p> <p>9×8</p> <p>$10 \times 8 = 80$ *we added one more group of 8 $80 - 8 = 72$ *we took that extra group of 8 away</p> <p>$9 \times 8 = 72$</p> <p>7×6</p> <p>$7 \times 5 = 35$ *start with a related known fact $35 + 7 = 42$ *adding one more group of 7</p> <p>$7 \times 6 = 42$</p>
Partial Products	Doubling and Halving	Breaking Factors into Smaller Factors
<p><i>Strategy Explained</i></p> <p>Students look at the numbers being multiplied and split one (or both) numbers into numbers they are comfortable with using.</p> <p>Example:</p>  <p>$10 \times 5 = 50$ $8 \times 5 = 40$ $50 + 40 = 90$</p>	<p><i>Strategy Explained</i></p> <p>Students understand that if they double one number and halve the other number they will have an equivalent expression.</p> <p>Example:</p> <p>16×8 $16 \times 8 = 32 \times 4$ $32 \times 8 = 64 \times 4$ $64 \times 4 = 128 \times 2$ $128 \times 2 = 256 \times 1$</p>	<p><i>Strategy Explained</i></p> <p>Students understand that they can divide a number into its factors if this makes the problem easier for them to solve.</p> <p>Example</p>  <p>$12 \times 6 = 2 \times 6 \times 6$ $12 \times 6 = 2 \times 36$ $12 \times 6 = 72$</p>  <p>$12 \times 13 = 3 \times 4 \times 13$ $12 \times 13 = 3 \times 52$ $12 \times 13 = 156$</p>

DIVISION

Fair Sharing/Sharing Out	Repeated Subtraction	Partial Quotients
<p><i>Strategy Explained</i></p> <p>Students share out into the corresponding number of groups until there are no more to share.</p> <p>Example:</p> $8 \div 4$ 	<p><i>Strategy Explained</i></p> <p>Students count backwards or repeatedly subtract to find the answer.</p> <p>Example:</p> $12 \div 4$ $12 - 4 = 8$ $8 - 4 = 4$ $4 - 4 = 0$ $12 \div 4 = 3$ $24 \div 6$ 	<p><i>Strategy Explained</i></p> <p>Students use facts they know to take chunks away until they arrive at the answer.</p> <p>Example:</p> $42 \div 3$ $30 \div 3 = 10$ *3 will fit into 42 at least 10 times, but still 12 left $12 \div 3 = 4$ *3 fits into the remaining 12, 4 times $42 \div 3 = 14$
Multiplying Instead	Halving and Halving	
<p><i>Strategy Explained</i></p> <p>Students use their understanding of multiplication to help them solve division questions. This works because multiplication and division are inverse operations.</p> $56 \div 8$ $8 \times ? = 56$ $8 \times 7 = 56$ $64 \div 8 = 7$	<p><i>Strategy Explained</i></p> <p>Students understand that if they divide each number in a division question by the same number, it will create an equivalent question. They can use this understanding to make the question easier for them to solve.</p> $96 \div 8$ $96 \div 8 = 48 \div 4$ *dividing each number by 2 $48 \div 4 = 24 \div 2$ *dividing each number by 2 again $24 \div 2 = 12 \div 1$ *dividing each number by 2 again $96 \div 8 = 12$ <p>Students do not have to divide each number by 2. If they can see that a bigger number is a factor of both numbers, they can divide with that number. In the above example, the student could have started to divide both number by 4.</p>
